

RECOVERY IMAGE - QUICK START

The Recovery Kit (USB Flash) will restore the HDD/SSD partition back to factory default overwriting all current data available on the HDD/SSD device. The recovery image is located either on a hidden partition image located on the computer unit (depending on product) or it is included as a image on the USB Flash Kit supporting all Computers and Maritime Panel Computers (MMC) models from Hatteland Technology. The recovery image file is not accessible from any Operating System (OS), only by the Recovery Kit (USB Flash). The USB Flash will not rescue or recover any deleted or lost data on device, it will overwrite the entire device with the factory OS image, thus you must ensure to create backups of current data (if needed) on device and/or re-install any custom software after the process below was performed. For more information, visit <https://www.hatteland-display.com/os>

Note that all files created after initial factory boot will be DELETED - make sure you do backup!

Restore from external USB recovery image:

- 1: Insert the USB Flash media into the computer usb connector.
- 2: Restart the computer.
- 3: On the first screen that appear, press "F11" on the keyboard to open Boot Manager Menu.
- 4: Select the USB Flash Media device from the list and press enter on keyboard to boot from it.
- 5: Follow the on screen instructions that will be executed from the USB Flash media, such as;
